Imron Corporation World Headquarters
Irvine, California

Introduction: Founded in 1997, Imron Corporation is a major provider of Security Management Systems to brand name manufacturers around the world. Today, the **IS2000** suite of scalable products is also available directly through systems integrators, providing advanced access control, alarm monitoring, CCTV interfacing, digital video surveillance, and seamless integration for multiple third party systems.

History: As a proven creator of licensed private labeled systems and software to manufacturers, Imron Corporation is a recognized leader for systems integration and software development with customers based worldwide.

Early products were first used by large-scale facilities to bridge the gap between separate systems from various manufacturers. These successes lead to the creation of private labeled systems and software for manufacturers to sell under their own brand names, providing integration solutions to large proprietary dealer groups.

In 2003, Imron Corporation expanded its operations to include complete system solutions direct to systems integrators, combining its state of the art software and field proven and reliable hardware in one value conscious package, the **IS2000.**

Reliability: Our commitment is to bring tomorrow's technology today. Our focus is on providing this while retaining our reputation for designing reliable systems and components that our customers count on every day.

With more than 100,000 total control panels installed and MTBF (mean time between failure) of greater than 1 million hours, the heart of the **IS2000** has twice the reliability of most commercially available PCs and hard drives.

For more information on Imron Corporation Systems, please contact us directly or speak with your Authorized IS2000 Systems Integrator.

Our Customers: The majority of our installations worldwide have been sold through our private label relationships with brand name hardware companies. Using their own brand names, these companies have combined our software systems with their own control systems or have sold our product mix of software and hardware bundled with their own products.

The Imron Corporation software and hardware platform has been installed and field-tested in more than a thousand sites throughout the world.

Private Branded – For more than 7 years our products have been sold to end users using our hardware platform for applications ranging from 1 to 1,000 doors. Most of these have been in the 4 to 256 door size, using the same basic platform as the IS2000 offers today. More than a dozen of these systems have been installed at large global operations that use the system to monitor and control hundreds of remote sites to this day.

Radionics® – Since 1998, our software was adapted to monitor and control large networks of primarily alarm and access control systems for Radionics, a leading name in security. Our PC9000 prize winning software with more than one thousand sites installed, these systems are mostly 2 to16 doors, and several are being used as proprietary monitoring points for large industrial and warehouse facilities.

PAC International – Following our earlier successes we introduced in 2001 a private label software package called VISION® that has provided a global access company with their newest generation of 32-bit network software for their dealers around the world. Sales of these systems have soared and are now widely accepted in 16 to 1,000 door applications.

You can rest assured with your choice of the **IS2000** system in the confidence that thousands of satisfied clients have already experienced the reliability, capability and value that will soon be yours.
